Web Basics – HTML5
Lesson 2. Tables

Capgemini

Lesson Objectives

After completing this module, you will be able to:
- Understand the structure of an HTML table.
- Controlling table format

2.1:Tables
Creating Tables

Table contains data in the format of rows and columns.
For an example, department information's are displayed in the tabular
format as shown below

Deptno	Dname	Location
10	Accounting	New York
20	Research	Dallas
30	Sales	Chicago
40	Operations	Boston

→ Row

Column named as "Deptno"

The above "Department" table contains 4 rows and 2 columns.

Tables

Tables are defined with the <table> tag. A table is divided into
rows (using <tr>), and each row is divided into data cells
(using <td>). Letters td stand for "table data," which is the
content of a data cell. A data cell can contain text, images,
lists, paragraphs, forms, horizontal rules, tables, etc.

2.1:Tables
Creating Tables

An HTML table can be created using <table> elements
- <table>
  - Define an HTML table
  - Other elements like <tr>, <caption>,.. can be nested inside <table> element

An HTML table has two kinds of cells
- Header Cells
  - <th>
    - Defines a table header

Standard Cells
- <tr>
  - Defines a table row
  - A row can have one or more <td> or <th> elements

<td>
- Defines a table cell data

Employee Name	Salary
Lathika	55000
Sandeep	32000
Ajay	99322

Header Cells

Standard Cells

An HTML table has two kinds of cells:

- Header Cells: Contain header information (created with the element).
- Standard Cells: Contain data (created with the td element).
- The text in a th element is bold and centered.
- The text in a td element is regular and left-aligned.

<tr> stands for Table row

<td> stands for table data

<th> stands for table header

2.1:Tables
Creating Tables

Syntax

```
<table>
    <tr> <th>Column1 Header</th> <th>Column2
Header</th></tr>
    <tr> <td>Cell 1,1</td> <td>Cell 1,2</td>
</tr>
    <tr> <td>Cell 2,1</td> <td>Cell 2,2</td>
</tr>
</table>
```

2.1:Tables
Creating Tables

Some more elements which can be used while creating tables are:
- <thead>
  - Group header content in an HTML table
- <tbody>
  - Group the body content in an HTML table
- <tfoot>
  - Group footer content in an HTML table
- <caption>
  - Defines a caption for the table
  - <caption> element should follow with <table> element immediately.
  - <caption> element value will be center aligned and displayed above the table

The table also has a few more tags to layout your data.

The <thead> tag is used to group the header content in an HTML table.The <thead> element should be used in conjunction with the <tbody> and <tfoot> elements.

The <tbody> element is used to group the body content in an HTML table and the <tfoot> element is used to group the footer content in an HTML table.

<tfoot> must appear before <tbody> within a table, so that a browser can render the foot before receiving all the rows of data.

Note that the <thead>,<tbody> and <tfoot> elements are seldom used, because of bad browser support. Expect this to change in future versions.
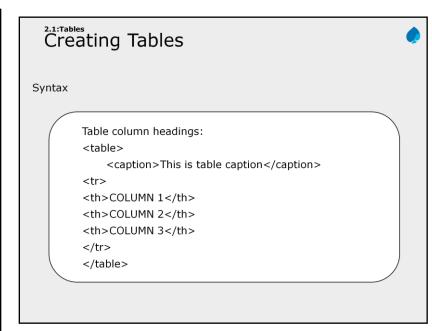

2.1:Tables
Creating Tables

Syntax

```
Table column headings:
<table>
     <caption>This is table caption</caption>
<tr>
<th>COLUMN 1</th>
<th>COLUMN 2</th>
<th>COLUMN 3</th>
</tr>
</table>
```

Table Caption:
- The <caption> tag defines a table caption.
- The <caption> tag must be inserted immediately after the <table> tag.
- You can specify only one caption per table. Usually the caption will be centered above the table.

Table Headers:
The <th> tag defines a header cell in an HTML table.

2.1:Tables
Creating Tables

Syntax

```
<table>
<thead>
<tr><td>.....</td></tr>
</thead>
<tfoot>
<tr><td>.....</td></tr>
</tfoot>
<tbody>
<tr><td>....</td></tr>
<tbody>
</table>
```

2.1:Tables
# Blank Data Cell (Code)

Inserting Blank Data Cell :
- `<td></td>`
- `<td><br></td>`

Blank Data Cell:

You can avoid missing a border around empty cells. Add a non-breaking space ( ) to empty data cells, to make the borders visible.

2.1:Tables
Creating Tables

Tableheading.html

2.1:Tables
Nested Tables (Code)

A cell can contain another table within it.

```
<table>
<tr> <th>Zone</th> <th> State </th> </tr>
<tr> <td>South</td>
<td><table>
<tr> <th>Name</th> <th>Capital City</th> </tr>
<tr> <td>Karnataka</td> <td>Bangalore</td> </tr>
<tr> <td>Tamilnadu</td> <td>Chennai</td> </tr>
<tr> <td>Andhra Pradesh</td> <td>Hyderabad</td>
 </tr>
</table></td></tr>
</table>
```

Zone	State	
South	**Name**	**Capital City**
	Karnataka	Bangalore
	Tamilnadu	Chennai
	Andhra Pradesh	Hyderabad

The table also has a few more tags to layout your data.

The <thead> tag is used to group the header content in an HTML table.The <thead> element should be used in conjunction with the <tbody> and <tfoot> elements.

The <tbody> element is used to group the body content in an HTML table and the <tfoot> element is used to group the footer content in an HTML table.

<tfoot> must appear before <tbody> within a table, so that a browser can render the foot before receiving all the rows of data.

Note that the <thead>,<tbody> and <tfoot> elements are seldom used, because of bad browser support. Expect this to change in future versions.

2.1:Tables
# Demo

tabnest4.htm

2.2: Table Formatting
Table Formatting

Cell Spanning
- Table cells can span across more than one column or row.
- Types of cell spanning
  - Row spanning
  - Column spanning

Example of Colspan

- Example of Rowspan

Employee Name	Salary
HR	
Lathika	55000
Sandeep	32000
SALES	
Sonia	43000
Raju	30022
Ajay	99932

Department Name	Employee Name	Salary
HR	Lathika	55000
	Sandeep	32000
Sales	Sonia	43000
	Raju	30022
	Ajay	99932

Cell Spanning:

There are two types of cell spanning. Row and column spanning.

2.2: Table Formatting
Cell Spanning (Code)

Row spanning/Column spanning:
▪ Use rowspan and colspan attribute either in <td> or <th> element.

```
<table>
<tr>
    <th rowspan=m>Multiple Column Header</th>
    <th colspan=n>Multiple Row Header</th>
</tr>
</table>
```
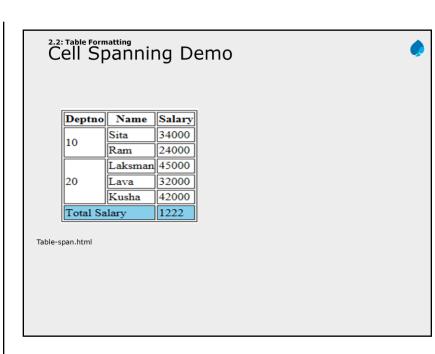

m & n are integers specifying number of rows and columns respectively.

colspan="number of columns" ~

By default, the number of columns in a table is defined by the number of table data cells appearing in the table row that contains the most data. You would, typically place the same number of data cells in each table row. If a table row does not contain the requisite number of table cells, then it will essentially be in 'error' and will be displayed with a missing cell.

rowspan="number of rows" ~

Rowspan attribute works just like the colspan attribute except that you may find the situation a little more difficult to visualize when working with the source code. But once again the principle is the same. By using the rowspan attribute, you can force a table cell to span the number of rows specified by the respective value.

2.2: Table Formatting

Cell Spanning Demo

Deptno	Name	Salary
10	Sita	34000
	Ram	24000
20	Laksman	45000
	Lava	32000
	Kusha	42000
Total Salary		1222

Table-span.html

2.2: Table Formatting

Grouping of Columns

<colgroup> tag specifies a group of one or more columns in a table for
    formatting
The <col> tag specifies column properties for each column within a
    <colgroup> element.
Use <colgroup> and <col> tags to group columns with common properties
    like
  ▪ Span attribute :
     •   Identifies number of columns in the current group.
     •   Default value is 1
     •   Provide span attribute and omit <col> tag
Example for grouping 3 columns and applying background color as green

```
<table>
        <colgroup span="3" style="background-color:green"> </colgroup>
        <col>
        <col>
        <tr>
                table contents......
        </tr>
</table>
```

colspan="number of columns" ~

By default, the number of columns in a table is defined by
the number of table data cells appearing in the table row that
contains the most data. You would, typically place the same
number of data cells in each table row. If a table row does not
contain the requisite number of table cells, then it will
essentially be in 'error' and will be displayed with a missing
cell.

rowspan="number of rows" ~

Rowspan attribute works just like the colspan attribute
except that you may find the situation a little more difficult to
visualize when working with the source code. But once again
the principle is the same. By using the rowspan attribute, you
can force a table cell to span the number of rows specified by
the respective value.

2.2: Table Formatting
Demo

tabcol3.htm

```
<html><head><title>Table with Colgroup</title></head>
<body>
<table  width="100%" frame="void">
<tr><th colspan="3">Ecommerce Stream</th>
<th colspan="4">Mainframe Stream</th>
<colgroup span="3" width="20%" bgcolor="orange">
<colgroup span="4" width="10%" bgcolor="lightgreen">
<tr><td>Internet/HTML<td>Javscript<td>Java
<td>CICS<td>COBOL<td>JCL<td>IMS
<tr><td>JSP<td>Servlet<td>Struts
<td>ADS/O<td>VSAM<td>IDMS<td>MVS
</table>
</html>
```
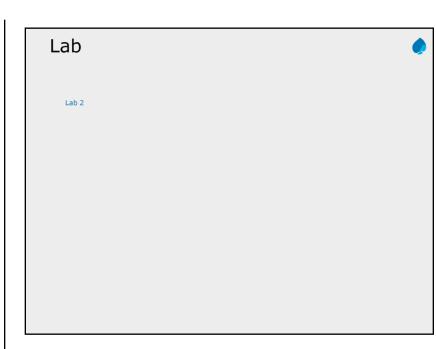

Lab

Lab 2

Lesson Summary

After completing this module you know:
- Structure of an HTML table
- Control table format such as cell spanning
- Use tables to format contents of an HTML Page.

Summary

Review - Questions

Question 1: Cell spanning is used to joining cells together to make a larger cell.
- True/False

Question 2: The <col> tag defines the attribute values for one or more columns in a table.
- True/ False

Question 3: In which tag usage of rowspan/colspan attribute is valid?
- <th>
- <tr>
- <td>
- None of the above
